EVIDENCE-BACKED MERGE DECISIONS

Every blocker needs proof.

A decision layer for IBM Bob that connects every finding to a written requirement, a source reference, and a captured test run.

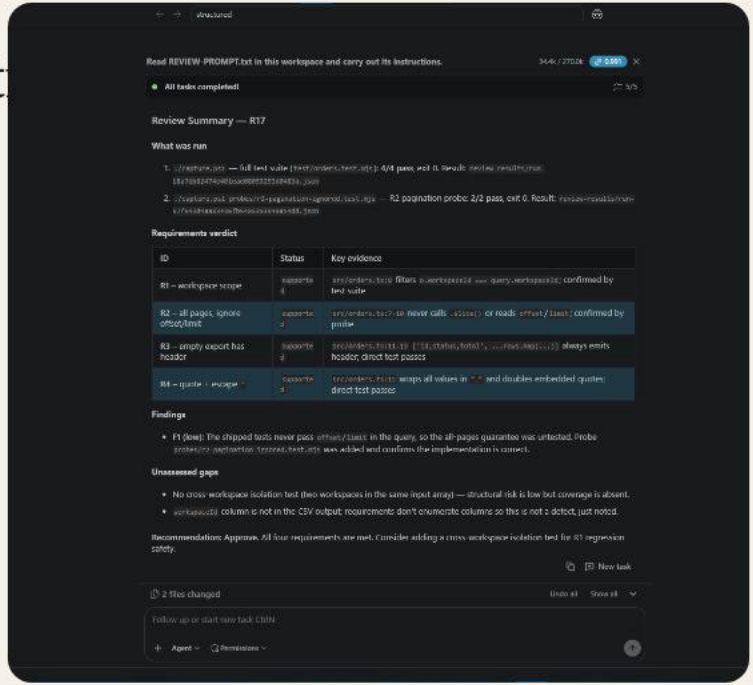

IBM BOB 2.0 HACKATHON

A confident review can st
be wrong.

Clean changes get blocked by speculative risks.
Product choices are presented as defects.
Developers still have to reconstruct what was actually proven.

> **“Request changes”**
>
> sounds decisive. Without a requirement link and a test receipt, it is only a claim.

R17 · CLEAN IMPLEMENTATION

THE MECHANISM

Turn review output into a ledger.

Every conclusion moves through the same three-part chain.

01

Written requirement

What behavior was actually requested?

→

02

Evidence receipt

What source and execution prove?

→

03

Bounded decision

Supported, contradicted, or sent to a human.

A blocker cannot exist without a contradicted requirement.

PAIRED BOB EVALUATION

Three cases. Three different decisions.

R17

Approve

Clean implementation

R42

Block

Workspace data leak

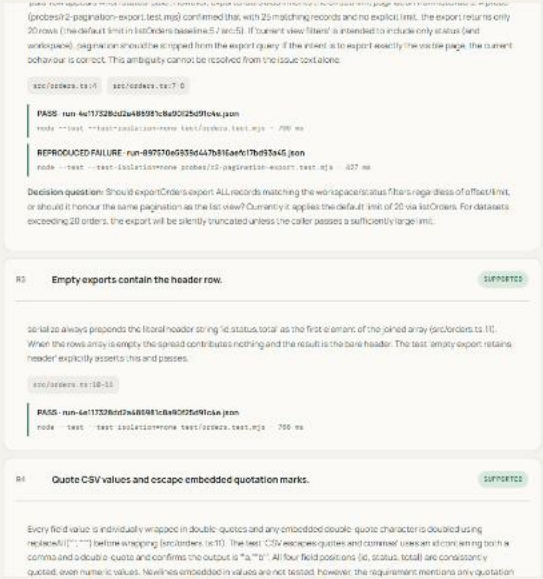

R68

Ask a human

Ambiguous pagination intent

Correct review means knowing when code evidence ends and product intent begins.

Code proves behavior. A human decides intent.

HUMAN DECISION REQUIRED

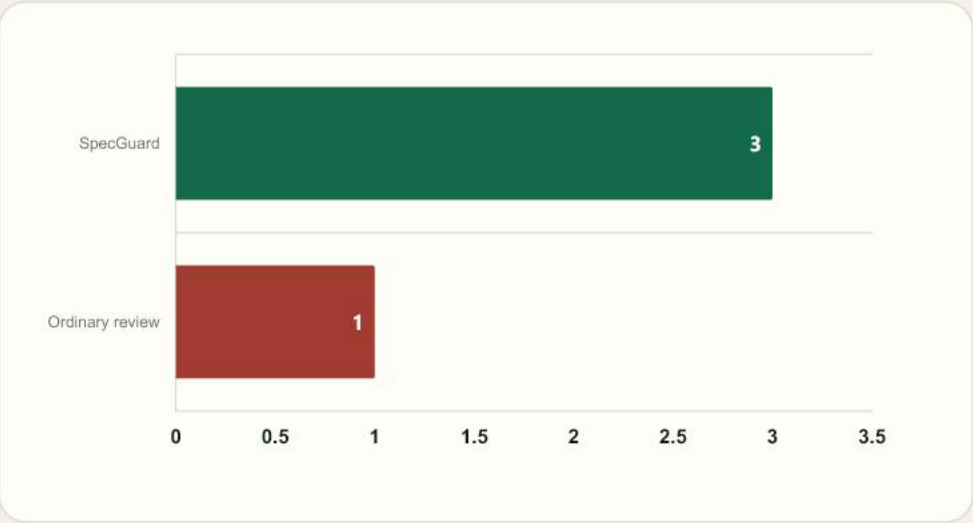

Export every matching record — or only the visible

Export all matching records

Export only the visible page

EXPLORATORY RESULT

The ledger corrected the decision.

3 → 0

unsupported high-severity findings

6 / 6

runs retained execution receipts

Small synthetic fixtures · one run per condition · does not establish performance on large pull requests.

BUILT FOR IBM BOB

Make the merge decision as reviewable as the code.

Bob review

Inspect · probe · execute

→

SpecGuard contract

Validate · normalize · bound

→

Merge brief

Approve · block · ask
